                                                                                                                   05-AUG-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           isolated CDNA clone (AAT66970). Active, activatable (i.e. proenzyme) or inactivated forms of CMH-1 can be expressed in prokaryotic or eukaryotic host cells. The polypeptides are useful for screening potential apoptosis inhibitors and for raising antibodies used to assay CMH-1, to regulate cholesterol levels, inhibit CMH-1 activity and therefore apoptosis, and to purify CMH-1 polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-NOV-1995;

                                                                                                                                                                                                                                                  Human Mch3-alpha (AAW15262) is an apoptotic protein and novel member of the interleukin-1-beta converting enzyme (ICE) family of cysteine proteases. Its amino acid sequence was deduced from a cDNA clone (AAT66992) obtd. from a Jurkat library. Mch3-beta (AAW15263) has also been identified that lacks the active site of Mch3-alpha. Mch3-alpha polypeptides can be produced in engineered host cells and used to treat human diseases associated with cell death, such as AIDS, ischaemic injury, neurodegenerative diseases, etc. They can also be used to regulate apoptosis and to screen for Mch3-alpha polypeptides.
                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                             New gene encoding Mch3, a cysteine protease that regulates - for treating human diseases associated with apoptosis, an screening for antagonists and agonists of Mch3

                                                                                                                                                                                                                 Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle is internalised by tumour cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase mediated apoptosis.
                                                                                                           Sequence
                                                                                                                                      gene
                                                                                                                                                enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAX81217 -AAX81226 represent human caspase genes encoding caspase 1-10
                                                                                                                                                                                                                                                                                                                                                            Disclosure; Fig 17A-B;

A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion polypeptide is used to identify a mutant cell line deficient in an enzyme of interest and is also useful for diagnosis and suppression of proliferation or metastases of a tumour cell characterised by overexpression of a polypeptide (e.g. Cathepsin B or urokinase, selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence. The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequences of human rev-caspase-3, uncleavable rev-caspase-3 and rev-caspase-6. The sequences can be used in the gene therapy of cancer and autoimmune diseases. The present sequence is a protein described in the exemplification of the

(I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present

(I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human caspase 7 protein, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence represents a human caspase 7 example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense compounds targeted to nucleic acids encoding caspase for modulating gene expression and treating diseases associated with expression of caspase 7 in humans \,

(I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent credience represents a human caspase 7 protein, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                  example

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        뫄
                                                                                                                                                                                                                          The present invention describes a compound (I) 8-50 nucleobases in clearly hargeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a mouse caspase 7 protein, which is used in an example from the present invention.
                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 11
                                  The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7.

(I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a mouse caspase 7 protein, which is used in an example from the present invention.

                                          The present invention relates to a molecule or molecular complex (I) comprising a binding pocket defined by the structure coordinates of caspase-7 amino acids 234, 235, 237, 276, 278, 281, and 284 or a homolo of (I) with a binding pocket having a root mean square deviation from t amino acid backbone atoms of not more than 1.5 Angstrom, where (I) has $4 binding region that is more hydrophilic than that of caspase-3. The present sequence is caspase-7, which was used in a sequence homology
                                                                                                                                                                                                                                                                                              Molecule or molecular complex used for drug discovery, comprises a binding pocket of caspase-7 or a homolog having an S4 binding region more hydrophilic than that of caspase-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Caspase-1; caspase-3.

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7 (I) has antiinflammatory and cytostatic activities, and can be used:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliterative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              not include the QACRG active site pentapeptide sequence of Mch3-alpha. Mch3-beta polypeptides can be produced in engineered host cells. They can be used as dominant/negative inhibitors of apoptotic Mch3-alpha to treat or reduce the severity of diseases characterised by increased programmed cell death, such as AIDS, ischammic injury, neurodegenerative diseases, etc., and can also
                                                                                                                                                                                                                                                                                                                                                                                                           W0200222640-A1
                                                                                                                                                                                                                                                                                                      11-SEP-2000; 2000US-0659860

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 unknown function cloned from Jurkat cells), the proteolytic product of which is the poly(DP-ribose) polymerase (PARP) protease, apopain. The PARP cleavage enzyme was purified from the human monocytic leukaemia cell line, THP-1, using standard ion exchange chromatography techniques and SDS PAGE. Apopain can be used to identify apopain activity modulators, while apopain encoding DNA may be used for apopain production or in gene therapy (i.e. in vivo or ex vivo gene transplantation) for enhancing the pro-inflammatory or pro-apoptotic effects of apopain. Anti-apopain antibodies and antisense DNA can be used to reduce or eliminate the pro-inflammatory or pro-apoptotic effects of apopain. Modulation of apopain activity is beneficial in the treatment of immune,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the CPP23beta or Glu190 isoform of the inactive CPP32 proenzyme (a member of the interleukin converting enzyme/pro-apoptotic protein CED-3 family of cysteine proteases of
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Apopain, a new human apoptosis related enzyme - responsible for the proteolytic breakdown of poly(ADP- ribose) polymerase (PARP) which occurs at the onset of apoptosis
                                                                                                                                           and Alzheimer's disease.
